To save a hide, and take all the belly and flank part of hide. Cut off all the meat (don't scrape.) Digs hole in ground, sets it in hole. Digs small hole in hide, and covers it with soft earth. A trench is dug deeper than the hole across rise. Small hot rocks are placed on top of the soft earth. Steam comes out of the trench orifice. When steam ceases then hide is thickening well. Then when thickened remove rocks and earth and take the hide out and examine. If thickened evenly put in the sun to dry. Some of the hides curdle and do spoil. If earth and rock heat are just right hide is perfect. No other part of hide needs do. Only belly & flank thicken and harden properly. Always when I should a hide out burned along the river.
